

Giovanna Di Chiro  
Earth and Environment Department  
Mount Holyoke College

Paper title “Seeking the New Biotechnological Fix: Toxicogenomics Research and Environmental Justice Policy in the United States”

Giovanna Di Chiro teaches in the Earth and Environment Department and the Gender Studies Department at Mount Holyoke College. She has published widely on the intersections of gender, race, and environmental justice. She is co-editor of the collection, *Appropriating Technology: Vernacular Science and Social Power* (University of Minnesota Press, 2004), which examines the benefits and pitfalls of adopting a variety of technologies to promote social and environmental justice. Currently she is completing her book, *Uncommon Expertise: Women, Science, and Environmental Politics*. This book explores the historical and cross-cultural emergence of the production of “uncommon expertise” (the blending of community-based environmental knowledge and university-generated scientific knowledge) through women activists' encounters with scientific institutions in grassroots environmental, health, and development struggles. She is a founder of the Pioneer Valley Community Environmental Health Coalition and works in collaboration with Nuestras Raíces—a Latino environmental justice organization—to conduct community-based participatory action research on environmental health disparities in the low-income Puerto Rican communities of western Massachusetts.
